                 Protocol Independent Multicast MIB for IPv4

Status of this Memo

   This memo defines an Experimental Protocol for the Internet
   community. It does not specify an Internet standard of any kind.
   Discussion and suggestions for improvement are requested.
   Distribution of this memo is unlimited.

Abstract

   This memo defines a portion of the Management Information Base (MIB)
   for use with network management protocols in the Internet community.
   In particular, it describes managed objects used for managing the
   Protocol Independent Multicast (PIM) protocol for IPv4.

Table of Contents

1. Introduction

   This memo defines a portion of the Management Information Base (MIB)
   for use with network management protocols in the Internet community.
   In particular, it describes managed objects used for managing the
   Protocol Independent Multicast (PIM) protocol [16,17,18,19]. This
   MIB module is applicable to IPv4 multicast routers which implement
   PIM. This MIB does not support management of PIM for other address
   families, including IPv6. Such management may be supported by other
   MIBs.

2. The SNMP Network Management Framework

   The SNMP Management Framework presently consists of five major
   components:

   o   An overall architecture, described in RFC 2271 [1].

   o   Mechanisms for describing and naming objects and events for the
         purpose of management. The first version of this Structure of
         Management Information (SMI) is called SMIv1 and described in
         STD 16, RFC 1155 [2], STD 16, RFC 1212 [3] and RFC 1215 [4].
         The second version, called SMIv2, is described in STD 58, RFC
         2578 [5], STD 58, RFC 2579 [6] and STD 58, RFC 2580 [7].

   o   Message protocols for transferring management information. The
         first version of the SNMP message protocol is called SNMPv1 and
         described in STD 15, RFC 1157 [8]. A second version of the SNMP
         message protocol, which is not an Internet standards track
         protocol, is called SNMPv2c and described in RFC 1901 [9] and
         RFC 1906 [10]. The third version of the message protocol is
         called SNMPv3 and described in RFC 1906 [10], RFC 2572 [11] and
         RFC 2574 [12].

   o   Protocol operations for accessing management information. The
         first set of protocol operations and associated PDU formats is
         described in STD 15, RFC 1157 [8]. A second set of protocol
         operations and associated PDU formats is described in RFC 1905
         [13].

   o   A set of fundamental applications described in RFC 2573 [14] and
         the view-based access control mechanism described in RFC 2575
         [15].

   Managed objects are accessed via a virtual information store, termed
   the Management Information Base or MIB. Objects in the MIB are
   defined using the mechanisms defined in the SMI.

This memo specifies a MIB module that is compliant to the SMIv2. A
MIB conforming to the SMIv1 can be produced through the appropriate
translations. The resulting translated MIB must be semantically
equivalent, except where objects or events are omitted because no
translation is possible (use of Counter64). Some machine readable
information in SMIv2 will be converted into textual descriptions in
SMIv1 during the translation process. However, this loss of machine
readable information is not considered to change the semantics of the
MIB.

3. Overview

This MIB module contains one scalar and eight tables. Some of the
objects in these tables are deprecated. This MIB contains deprecated
objects since they are necessary for managing PIMv1 routers, but
PIMv1 itself is obsoleted by PIMv2 [18,19].

The tables contained in this MIB are:

(1)   The PIM Interface Table contains one row for each of the
       router's PIM interfaces.

(2)   The PIM Neighbor Table contains one row for each of the router's
       PIM neighbors.

(3)   The PIM IP Multicast Route Table contains one row for each
       multicast routing entry whose incoming interface is running PIM.

(4)   The PIM Next Hop Table which contains one row for each outgoing
       interface list entry in the multicast routing table whose
       interface is running PIM, and whose state is pruned.

(5)   The (deprecated) PIM RP Table contains the PIM (version 1)
       information for IP multicast groups which is common to all RPs
       of a group.

(6)   The PIM RP-Set Table contains the PIM (version 2) information
       for sets of candidate Rendezvous Points (RPs) for IP multicast
       group addresses with particular address prefixes.

(7)   The PIM Candidate-RP Table contains the IP multicast groups for
       which the local router is to advertise itself as a Candidate-RP.
       If this table is empty, then the local router advertises itself
       as a Candidate-RP for all groups.

(8)   The PIM Component Table contains one row for each of the PIM
       domains to which the router is connected.

        DESCRIPTION
                "A collection of optional objects to provide extra
                information about the assert election process.  There is no
                protocol reason to keep such information, but some
                implementations may already keep this information and make
                it available.  These objects can also be very useful in
                debugging connectivity or duplicate packet problems,
                especially if the assert winner does not support the PIM and
                IP Multicast MIBs."
        ::= { pimMIBGroups 7 }

END
```

5. Security Considerations

    This MIB contains readable objects whose values provide information
    related to multicast routing, including information on the network
    topology. There are also a number of objects that have a MAX-ACCESS
    clause of read-write and/or read-create, which allow an administrator
    to configure PIM in the router.

    While unauthorized access to the readable objects is relatively
    innocuous, unauthorized access to the write-able objects could cause
    a denial of service. Hence, the support for SET operations in a
    non-secure environment without proper protection can have a negative
    effect on network operations.

    SNMPv1 by itself is such an insecure environment. Even if the
    network itself is secure (for example by using IPSec), even then,
    there is no control as to who on the secure network is allowed to
    access and SET (change/create/delete) the objects in this MIB.

It is recommended that the implementers consider the security features as provided by the SNMPv3 framework. Specifically, the use of the User-based Security Model RFC 2274 [12] and the View-based Access Control Model RFC 2275 [15] is recommended.

It is then a customer/user responsibility to ensure that the SNMP entity giving access to this MIB, is properly configured to give access to those objects only to those principals (users) that have legitimate rights to access them.

6. Intellectual Property Notice

The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on the IETF's procedures with respect to rights in standards-track and standards-related documentation can be found in BCP-11. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF Secretariat.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights which may cover technology that may be required to practice this standard. Please address the information to the IETF Executive Director.

7. Acknowledgements

This MIB module has been updated based on feedback from the IETF's Inter-Domain Multicast Routing (IDMR) Working Group.
