                    SNMP MIB Extension for X.25 LAPB

Status of this Memo

   This RFC specifies an IAB standards track protocol for the Internet
   community, and requests discussion and suggestions for improvements.
   Please refer to the current edition of the "IAB Official Protocol
   Standards" for the standardization state and status of this protocol.
   Distribution of this memo is unlimited.

Abstract

   This memo defines a portion of the Management Information Base (MIB)
   for use with network management protocols in TCP/IP-based internets.
   In particular, it defines objects for managing the Link Layer of
   X.25, LAPB. The objects defined here, along with the objects in the
   "SNMP MIB Extension for the Packet Layer of X.25" [9] and the
   "Definitions of Managed Objects for RS-232-like Hardware Devices"
   [8], combine to allow management of an X.25 protocol stack.

Table of Contents

1. The Network Management Framework

   The Internet-standard Network Management Framework consists of three
   components. These components give the rules for defining objects,
   the definitions of objects, and the protocol for manipulating
   objects.

   The network management framework structures objects in an abstract
   information tree. The branches of the tree name objects and the
   leaves of the tree contain the values manipulated to effect
   management. This tree is called the Management Information Base or
   MIB. The concepts of this tree are given in STD 16/RFC 1155 "The
   Structure of Management Information" or SMI [1]. The SMI defines the
   trunk of the tree and the types of objects used when defining the
   leaves. STD 16/RFC 1212, "Towards Concise MIB Definitions" [4],
   defines a more concise description mechanism that preserves all the
   principals of the SMI.

   The core MIB definitions for the Internet suite of protocols can be
   found in RFC 1156 [2] "Management Information Base for Network
   Management of TCP/IP-based internets". STD 17/RFC 1213 [5] defines
   MIB-II, an evolution of MIB-I with changes to incorporate
   implementation experience and new operational requirements.

   STD 15/RFC 1157 [3] defines the SNMP protocol itself. The protocol
   defines how to manipulate the objects in a remote MIB.

   The tree structure of the MIB allows new objects to be defined for
   the purpose of experimentation and evaluation.

2. Objects

   The definition of an object in the MIB requires an object name and
   type. Object names and types are defined using the subset of the
   Abstract Syntax Notation One (ASN.1) [6] defined in the SMI [1].
   Objects are named using ASN.1 object identifiers, administratively
   assigned names, to specify object types. The object name, together
   with an optional object instance, uniquely identifies a specific
   instance of an object. For human convenience, we often use a textual
   string, termed the OBJECT DESCRIPTOR, to also refer to objects.

   Objects also have a syntax that defines the abstract data structure
   corresponding to that object type. The ASN.1 language [6] provides

the primitives used for this purpose. The SMI [1] purposely
restricts the ASN.1 constructs which may be used for simplicity and
ease of implementation. The encoding of an object type simply
describes how to represent an object using ASN.1 encoding rules [7],
for purposes of dealing with the SNMP protocol.

2.1. Format of Definitions

Section 4 contains the specification of all object types defined in
this MIB module. The object definitions use the conventions given in
the SMI [1] as amended by the concise MIB definitions [4].

3. Overview

3.1. Informal overview

This section describes how the objects defined below relate with
other MIBs. This section is only informational to help understand
how the pieces fit together.

The objects defined below are to be used in conjunction with MIB-II
and other MIBs such as the X.25 packet level MIB [9]. A system with
a complete X.25 stack running over a synchronous line will have at
least two interfaces in the ifTable defined in MIB-II. There will be
an interface for LAPB and another interface for the packet layer of
X.25. There will also be objects defined in the RS-232-like MIB for
the physical sync line.

Each software interface identifies the layer below it used to send
and receive packets. The X.25 MIB object, x25InfoDataLinkId,
specifies an instance of lapbAdmnIndex for the LAPB interface under
that X.25. The LAPB object, lapbOperPortId, defined below, identifies
an instance of the rs232PortIndex for the the Sync line used by LAPB.

For X.25 running over LAPB over Ethernet, the lapbAdmnPortId would
identify the instance of ifIndex for the Ethernet interface.

Each X.25 subnetwork will have separate entries in the ifTable. Thus
a system with two X.25 lines would have two ifTable entries for the
two X.25 packet layers and two other entries for the two LAPB
interfaces. Each X.25 Packet Layer MIB would identify the instance of
the LAPB MIB below it. Each LAPB MIB would identify the Sync line
below it. The system would also have two entries for rs232PortTable
and rs232SyncPortTable for the two physical lines.

Since the ifTable as defined in MIB-II is device independent, it
doesn't have anything specific for any type of interface. The
objects below define the LAPB specific information for an interface

of type LAPB. Different LAPB interfaces can also be differentiated by
matching the values of ifIndex with lapbAdmnIndex.

3.2. Textual Conventions

   Two new data types are introduced as a textual conventions in this
   MIB document. These textual conventions enhance the readability of
   the specification and can ease comparison with other specifications
   if appropriate. It should be noted that the introduction of these
   textual conventions has no effect on either the syntax nor the
   semantics of any managed objects. The use of these is merely an
   artifact of the explanatory method used. Objects defined in terms of
   one of these methods are always encoded by means of the rules that
   define the primitive type. Hence, no changes to the SMI or the SNMP
   are necessary to accommodate these textual conventions which are
   adopted merely for the convenience of readers and writers in pursuit
   of the elusive goal of clear, concise, and unambiguous MIB documents.

   This MIB introduces the data types of:

                    PositiveInteger
                    ifIndexType

3.3. Formal overview

   Instances of the objects defined below represent attributes of a LAPB
   interface. LAPB interfaces are identified by an ifType object in the
   Internet-standard MIB [5] of

            lapb(16).

   For these interfaces, the value of the ifSpecific variable in the
   MIB-II [5] has the OBJECT IDENTIFIER value:

            lapb   OBJECT IDENTIFIER ::= { transmission 16 }

   The relationship between a LAPB interface and an interface in the
   context of the Internet-standard MIB [5] is one-to-one. As such, the
   value of an ifIndex object instance can be directly used to identify
   corresponding instances of the objects defined below.

   The objects defined below are defined in the context of ISO 7776 [10]
   and ISO 8885 [11]. Access to those documents maybe useful (but isn't
   essential) to understand the names and semantics of some objects.
   Where possible the object descriptions use the terminology of ISO
   7776; for example, one commonly used term refers to the peer LAPB as
   the DCE/remote DTE. This terminology does not restrict the
   instrumented LAPB to function only as a DTE. This MIB maybe applied

to a LAPB configured as either a DCE or a DTE.

To the extent that some attributes defined in the Internet standard
MIB [5] are applicable to LAPB, those objects have not been
duplicated here. In some instances some clarification of how to
apply those objects to LAPB has been given.

Some objects defined below include a DEFVAL clause. This clause
provides reasonable (but not mandatory) default values to use when
creating these objects. This does not imply this MIB defines any
mechanism for creating or deleting LAPB interfaces. The creation and
deletion of the objects of this MIB depend on the implementation
method for creating and deleting LAPB interfaces. The DEFVAL clause
provides reasonable defaults to allow further extension of the MIB to
define methods for creating and deleting LAPB interfaces without
having to deprecate these objects for the lack of a DEFVAL clause.

3.4. Tables

This extension adds four tables to the MIB. These tables are:

                        lapbAdmnTable,
                        lapbOperTable,
                        lapbFlowTable, and
                        lapbXidTable.

The lapbAdmnTable provides objects for common parameters used by LAPB
such as the T1 retransmission timer or the N2 retransmission counter.
Changes to objects in this table need not affect a running interface
but provides access to the values used to initialize an interface.
These values are read-write.

The lapbOperTable provides objects to determine the parameters
actually in use by an interface. These objects are read only. The
values currently in use maybe different from the lapbAdmnTable values
if the lapbAdmnTable was changed after interface initialization or if
XID negotiation selected different values.

The lapbFlowTable provides objects that report how the LAPB interface
performs. These are read-only objects used to monitor operation.

The lapbXidTable is not required for systems that do not transmit XID
frames. For systems that do transmit XID frames, this table provides
the values for the fields of the XID frame that are not already
present in the lapbAdmnTable. The objects in this table are read-
write.

3.5. Traps

   Since all LAPB interfaces have entries in the ifTable, significant
   changes in the state of the interface should send a linkUp or
   linkDown trap. Thus an interface that receives or sends a Frame
   Reject frame should send a linkDown trap. If the interface later
   comes back up, it should then send a linkUP trap.

4. Object Definitions

         RFC1381-MIB DEFINITIONS ::= BEGIN

         IMPORTS
                 Counter
                         FROM RFC1155-SMI
                 transmission
                         FROM RFC1213-MIB
                 OBJECT-TYPE
                         FROM RFC-1212;

                         -- LAPB MIB

         lapb   OBJECT IDENTIFIER ::= { transmission 16 }

         PositiveInteger ::= INTEGER (0..2147483647)

         IfIndexType   ::= INTEGER (1..2147483647)
         -- IfIndexType specifies an index object for a table
         -- with entries that match entries in the MIB-II ifTable.
         -- The value of the index for the table will match the
         -- ifIndex entry for same interface in the ifTable.
         -- The values of this object range from 1 to ifNumber
         -- inclusive.

         -- ###
         --   LAPB Admn Table
         -- ###

         -- Support of the lapbAdmnTable is mandatory for all
         -- agents of systems that implement LAPB.

         lapbAdmnTable   OBJECT-TYPE
                 SYNTAX   SEQUENCE OF LapbAdmnEntry
                 ACCESS   not-accessible
                 STATUS   mandatory

                    DESCRIPTION
                            "This table contains objects that can be
                            changed to manage a LAPB interface.
                            Changing one of these parameters may take
                            effect in the operating LAPB immediately or
                            may wait until the interface is restarted
                            depending on the details of the
                            implementation.

                            Most of the objects in this read-write table
                            have corresponding read-only objects in the
                            lapbOperTable that return the current
                            operating value.

                            The operating values may be different from
                            these configured values if changed by XID
                            negotiation or if a configured parameter was
                            changed after the interface was started."
                    ::= { lapb 1 }

                ::= { lapb 5 }

        lapbProtocolIso7776v1986 OBJECT IDENTIFIER
                ::= { lapbProtocolVersion 1 }

        lapbProtocolCcittV1980 OBJECT IDENTIFIER
                ::= { lapbProtocolVersion 2 }

        lapbProtocolCcittV1984 OBJECT IDENTIFIER
                ::= { lapbProtocolVersion 3 }

        -- The following describes some of the MIB-II interface
        -- objects and their relationship with the objects in this
        -- MIB extension.

        -- ifDescr:  describes the interface.   It should include
        -- identification information for the physical line and a
        -- description of the network.  For connections to PDNs,
        -- it should name the PDN.

        -- ifMtu: the maximum number of octets an upper layer can
        -- pass to this interface as a single frame.

        -- ifSpeed:
```

```
        -- ifAdminStatus:

        -- ifOperStatus:

        -- ifLastChange: the last time the state of the interface
        -- changed.  A reset is considered an instantaneous change to
        -- the ndm state and back to abm or abme.  This will be the
        -- last time that lapbFlowChangeReason and lapbFlowChanges
        -- changed.

        -- ifInOctets: contains the number of octets
        -- received from the peer LAPB including FCS.

        -- ifInUcastPkts: contains the number of I-frames delivered
        -- by this interface to a higher layer interface.

        -- ifInDiscards: contains the number of received
        -- frames discarded because of internal conditions
        -- (such as lack of buffering).

        -- ifInErrors: contains the number of Invalid frames received.
        -- This does not have any relationship with the number REJ,
        -- or RNR frames sent or received.

        -- ifInUnknownProtos: contains the number of frames
        -- that were correct but were dropped because they
        -- were inappropriate for the current state.  This
        -- includes an invalid Poll bit, an unknown address,
        -- or other condition such as an RNR when connection
        -- not established.  This also includes the number of
        -- DISC or other frames that were ignored because the
        -- link was not established and this interface was not
        -- configured to perform link setup on that type frame.

        -- ifOutOctets: number of octets sent to peer including
        -- FCS octets.

        -- ifOutUcastPkts: number of I-frames received from
        -- a higher layer for transmission to peer.

        -- ifOutDiscards: number of frames to be sent that were
        -- dropped due to internal conditions such as buffering etc.

        -- ifOutErrors: number of transmissions that failed
        -- due to errors or were considered invalid by the receiver.
        -- This does not have any relationship with the number REJ,
        -- or RNR frames sent or received.
```

```
           -- ifOutQLen: number of frames waiting to be transmitted.

           -- This MIB does not provide any support for:
           --       Multilink procedure (MLP) in ISO 7776 section 6
           --       LLC Pbit timer
           --       LLC REJ timer
           --       LLC Busy State Timer 7.8.1.4

           -- ##########################################################

        END
```

5. Appendix: Revision History

July 30, 1992

The July revision of this document (Editor's Internal Reference 2.10)
incorporated the comments of the SNMP directorate.

    The ifIndexType textual convention was added and used as the type
    for all index objects.

    The enumeration xidDetection of the lapbAdmnStationType was
    changed to dxe to be consistent with other similar enumerations.

    Conformance statements were added at before every table as ASN.1
    comments.

June 12, 1992

    The June 12, 1992 revision of this document (Editor's Internal
    Reference 2.9) incorporated some clarifications and updated the
    status.

    The range on PositiveInteger was changed to start at 0 rather than
    1.

    The syntax of lapbXidIndex was changed to PositiveInteger.

    A value of dxe was added to lapbOperStationType.

    The range of lapbAdmnN2RxmitCount was change to (0..65535).

    The definition of ifInOctets, ifInUcastPkts, ifInErrors,
    ifInUnknownProtos, ifOutOctets, and ifoutUcastPkts was clarified.

May 18, 1992

   The May 18, 1992 revision of this document (Editor's Internal
   Reference 2.8) incorporated the following changes:

      The states of lapbFlowCurrentMode were redefined.

      The default value for lapbAdmnControlField was changed from
      module8 to modulo8.

April 8, 1992

   The April 8, 1992 revision of this document (Editor's Internal
   Reference 2.4) incorporated the following changes:

      All reference comments in the MIB were moved to the REFERENCE
      field of the OBJECT-TYPE macro.

      A type of PositiveInteger was introduced and used for common
      integer values including all timers. This effectively made the
      maximum value for timers 2147483646 milliseconds. The type of the
      frame size was changed to positiveInteger.

      The reference to ISO 7776 has been broadened to say the MIB
      descriptions use the terminology of ISO 7776.

      A comment was added to the overview section discussing creation
      and deletion of tables.

      The objects in the lapbParmTable and lapbDefTable were
      redistributed to create a lapbOperTable, a lapbAdmnTable, and a
      lapbXidTable. The lapbParmTable and lapbDefTable were deleted.
      Objects were included in the Admn table for t3 and t4.

      An object identifier was added to identify the protocol version.

      A DEFVAL clause was added for all writable objects.

      Some more overview text was included.

February 1992

   The February 1992 revision of this document (Editor's Internal
   Reference 1.17) incorporated the following changes:

      The name was changed from HDLC to LAPB. This change was made
      because other flavors of HDLC such as LAPD, SDLC, and raw HDLC
      framing, are different enough that this MIB will not adequately

   manage them.

   The Historical Perspective section at the beginning of the
   document has been replaced with a more concise Network Management
   Framework section.

   The name lapbParmKWindowSize was changed to
   lapbParmTransmitKWindowSize and the object
   lapbParmReceiveKWindowSize was added. This change was made because
   section 5.7.4 of ISO 7776 and Table 3 of ISO 8885 have provisions
   for different values for the transmit and receive window size.

   The name lapbParmN1FrameSize was changed to
   lapbParmTransmitN1FrameSize and the object
   lapbParmReceiveN1FrameSize was added. This change was made because
   section 5.7.3 of ISO 7776 and Table 3 of ISO 8886 have provisions
   for different values for the transmit and receive maximum frame
   size.

   The object lapbParmPortIndex was deleted and the description of
   lapbParmPortId was changed. The object lapbParmPortId now
   identifies an instance of the index object for the MIB of the
   physical device or interface below LAPB.

   The units for the timers were changed to Milliseconds to be
   consistent with ISO 8885; see table 3.

   The objects lapbParamT2AckDelayTimer and
   lapbParamT3DisconnectTimer both allow values of 0 to indicate the
   timer is not being used.

   The object lapbParamT4IdleTimer has a value to indicate timer not
   in use.

   The object lapbFlowXidReceived was added to the flow table.

   The lapbDefTable was added.

   Ranges and sizes were added for all INTEGERs and OCTET STRINGs
   that didn't have them.

October 1991

   The October 1991 revision of this document basically changed the name
   from LAPB to HDLC to make the objects more appropriate for a broader
   range of uses. A number of minor changes were made to bring the
   objects in line with established conventions. These changes are as
   follows.

      The enumerated values of hdlcParmStationType were renumbered from
      0 and 1 to 1 and 2.

      The object hdlcFlowBusyDefer was renamed hdlcFlowBusyDefers.

      The object hdlcFlowRejSent was rename hdlcFlowRejOutPkts.

      The object hdlcFlowRejReceived was renamed hdlcFlowRejInPkts.

June 1991

   The June revision of this document incorporated much of the E-mail
   discussion of the first draft. In particular it replaced the
   lapbStatTable (and all contents) with the lapbFlowTable.

April 1991

   The April 24 version of this document was the first release. At that
   time this document was basically a bunch of objects synthesized from
   various vendor MIBs and a quick reading of ISO 7776 [10]. On first
   reading it appeared to instrument too many LAPB normal functions and
   too few exceptional conditions. The lapbStatTable was too long and
   needed to be redone.
