## Definitions of Managed Objects for APPN/HPR in IP Networks

### Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

### Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it defines objects for monitoring and controlling HPR (High Performance Routing) network devices which have the capability to communicate in IP (Internet Protocol) networks. This memo identifies managed objects for the HPR in IP network communications.

## 1. Introduction

This document is a product of the SNA NAU Services MIB Working Group. It defines a MIB module for managing devices with HPR in IP networks capabilities.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [17].

## 2. The SNMP Network Management Framework

The SNMP Management Framework presently consists of five major components:

- o An overall architecture, described in RFC 2271 [1].
- o Mechanisms for describing and naming objects and events for the purpose of management. The first version of this Structure of Management Information (SMI) is called SMIV1 and described in STD 16, RFC 1155 [2], STD 16, RFC 1212 [3] and RFC 1215 [4]. The second version, called SMIV2, is described in STD 58, RFC 2478 [5], RFC 2579 [6] and RFC 2580 [7].
- o Message protocols for transferring management information. The first version of the SNMP message protocol is called SNMPv1 and described in STD 15, RFC 1157 [8]. A second version of the SNMP message protocol, which is not an Internet standards track protocol, is called SNMPv2c and described in RFC 1901 [9] and RFC 1906 [10]. The third version of the message protocol is called SNMPv3 and described in RFC 1906 [10], RFC 2272 [11] and RFC 2274 [12].
- o Protocol operations for accessing management information. The first set of protocol operations and associated PDU formats is described in STD 15, RFC 1157 [8]. A second set of protocol operations and associated PDU formats is described in RFC 1905 [13].
- o A set of fundamental applications described in RFC 2273 [14] and the view-based access control mechanism described in RFC 2275 [15].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the mechanisms defined in the SMI.

This memo specifies a MIB module that is compliant to the SMIV2. A MIB conforming to the SMIV1 can be produced through the appropriate translations. The resulting translated MIB must be semantically equivalent, except where objects or events are omitted because no translation is possible (use of Counter64). Some machine readable information in SMIV2 will be converted into textual descriptions in SMIV1 during the translation process. However, this loss of machine readable information is not considered to change the semantics of the MIB.

### 3. Overview

This document identifies a set of objects for monitoring the configuration and active characteristics of devices with HPR in IP network capabilities. HPR is an enhancement to the Advanced Peer-to-Peer Network (APPN) architecture that provides fast data routing and improved session reliability. APPN is the aspect of Systems Network Architecture (SNA) that supports peer-to-peer networking. APPN/HPR in IP Networks is a further enhancement to the APPN/HPR architecture, described in RFC 2353 [18]. It provides a method with which APPN/HPR nodes can communicate in IP networks.

APPN management information is defined by the APPN MIB [19]. HPR management information is defined by the HPR MIB, RFC 2238 [20].

Highlights of the management functions supported by the APPN/HPR in IP Networks MIB module include the following:

- o A count of UDP packets sent with each type of APPN traffic on HPR/IP links.
- o Monitoring and setting configuration parameters for the mappings between APPN traffic types on Type of Service (TOS) Precedence settings in the IP header. Note that the TOS Precedence settings have been redefined in RFC 2474 [21] as the first three bits of the differentiated services code point (DSCP).

This MIB module does not support:

- o Configuration of IP addresses used for APPN ports or link stations.

#### 3.1. HPR/IP Values for Objects in the APPN MIB

Ports and link stations are the APPN device's interface to the data link control (DLC), which provides the physical transport, or to another protocol, such as IP. The APPN MIB identifies ports and link stations using IP as the transport with the following objects:

- o appnPortDlcType
- o appnLsDlcType
- o appnLsStatusDlcType

These objects all have the syntax IANAIfType, and the value 126, defined as "IP (for APPN HPR in IP networks)" shall be returned when they identify an HPR/IP port or link station.

The IP address used for the port or link station is returned in the following objects:

- o appnPortDlcLocalAddr
- o appnLsLocalAddr
- o appnLsRemoteAddr
- o appnLsStatusLocalAddr
- o appnLsStatusRemoteAddr

These objects have the syntax DisplayableDlcAddress, defined in the APPN MIB as a textual convention to represent the address as an octet string of ASCII characters.

The following two objects return object identifiers that tie port and link table entries in the APPN MIB to lower-layer MIB entries:

- o appnPortSpecific
- o appnLsSpecific

Both objects should return a RowPointer to the ifEntry in the agent's ifTable for the physical interface associated with the local IP address for the port. If the agent implements the IP-MIB (RFC 2011), this association between the IP address and the physical interface will be represented in the ipNetToMediaTable.

### 3.2. APPN/HPR in IP Networks MIB Structure

The APPN/HPR in IP Networks MIB module contains two groups of objects:

- o hprIpMonitoringGroup - an object for counting outgoing HPR/IP traffic for each APPN traffic type

- o hprIpConfigurationGroup - objects to represent TOS Precedence to APPN traffic type mappings

These groups are described below in more detail.

### 3.2.1. hprIpMonitoringGroup

The hprIpMonitoringGroup group consists of the hprIpActiveLsTable. This table is indexed by the link station name and traffic type, and contains a counter for the number of UDP packets sent on a link station for that traffic type.

### 3.2.2. hprIpConfigurationGroup

The hprIpMonitoringGroup group consists of the following objects and tables:

#### 1) hprIpAppnPortTable

This table supports reading and setting the default mapping between APPN traffic types and TOS Precedence settings for all link stations using a port. This mapping may be overridden for individual link stations or individual connection networks.

#### 2) hprIpLsTable

This table supports reading and setting the mappings between APPN traffic types and TOS Precedence settings for an individual link station and APPN traffic type. If there is no entry in this table for a given link station and traffic type, then that link station inherits its mapping from its port.

#### 3) hprIpCnTable

This table supports reading and setting the mapping between APPN traffic types and TOS Precedence settings for an individual connection network and traffic type. If there is no entry in this table for a given connection network and traffic type, then that connection network inherits its mapping from its port.

DESCRIPTION

```

```

    "The MIB module for HPR over IP.  This module contains two
    groups:

```

- the HPR over IP Monitoring Group provides a count of the UDP packets sent by a link station for each APPN traffic type.
- the HPR over IP Configuration Group provides for reading and setting the mappings between APPN traffic types and TOS Precedence settings in the IP header. These mappings are

configured at the APPN port level, and are inherited by the APPN connection networks and link stations associated with an APPN port. A port-level mapping can, however, be overridden for a particular connection network or link station."

REVISION "9809240000Z" -- September 24, 1998

DESCRIPTION

"This object allows entries to be created and deleted in the hprIpLsTable. As soon as an entry becomes active, the mapping between APPN traffic types and TOS Precedence settings that it specifies becomes effective.

The value of the other accessible object in this entry, hprIpLsTOSPrecedence, can be changed via a Set operation when this object's value is active(1).

An entry in this table is deleted by setting this object to destroy(6). Deleting an entry in this table causes the link station to revert to the default TOS Precedence mapping for its port."

::= { hprIpLsEntry 4 }

```
-- *****
hprIpCnTable OBJECT-TYPE
    SYNTAX SEQUENCE OF HprIpCnEntry
    MAX-ACCESS not-accessible
    STATUS current
    DESCRIPTION
        "The HPR/IP connection network table.  Values for TOS
        Precedence at the connection network level override those at
        the level of the containing port.  If there is no entry in
        this table for a given connection network, then that
        connection network inherits its TOS Precedence values from
        its port.

        A node may have connections to a given connection network
        through multiple ports.  There is no provision in the HPR-IP
        architecture for variations in TOS Precedence values for
        a single connection network based on the port through which
        traffic is flowing to the connection network.  Thus an entry
        in this table overrides the port-level settings for all the
        ports through which the node can reach the connection
        network."

## 5. Security Considerations

Certain management information defined in this MIB may be considered sensitive in some network environments. Therefore, authentication of received SNMP requests and controlled access to management information SHOULD be employed in such environments. An authentication protocol is defined in [12]. A protocol for access control is defined in [15]. It is a customer responsibility to properly set up access control for MIB access.

None of the read-only objects in this MIB reports a password, user data, or anything else that is particularly sensitive. Some enterprises view their network configuration itself, as well as information about network usage and performance, as corporate assets; such enterprises may wish to restrict SNMP access to most of the objects in the MIB.

The one read-write and four read-create objects in the MIB can affect network operations; it is recommended that SNMP access to these objects be restricted. The five objects are:

- o `hprIpPortTOSPrecedence`: Setting this object immediately changes the mapping for all link stations using this port which do not have an entry to override the port value. Improper mappings may cause delays or disruptions in the network. For example, if APPN traffic type 'High' is mapped to IP TOS Precedence bits '001', network control traffic will have the same TOS precedence as bulk data traffic. This may cause delays with session initializations, and timeouts on control sessions that could cause network outages.
- o `hprIpLsTOSPrecedence`: Setting this object has the potential for delay or disruption for this link station as described above with `hprIpPortTOSPrecedence`.
- o `hprIpLsRowStatus`: Setting this object to `delete(6)` causes this link station to revert to the default TOS Precedence mapping for its port. The customized mapping for this link station will no longer be in effect.
- o `hprIpCnTOSPrecedence`: Setting this object has the potential for delay or disruption for this links created for this connection network as described above with `hprIpPortTOSPrecedence`.
- o `hprIpCnRowStatus`: Setting this object to `delete(6)` causes links created for this connection network to revert to the default TOS Precedence mapping for its port. The customized mapping for this connection network will no longer be in effect.

## 6. Intellectual Property

The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on the IETF's procedures with respect to rights in standards-track and

standards-related documentation can be found in BCP-11 [16]. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF Secretariat.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights which may cover technology that may be required to practice this standard. Please address the information to the IETF Executive Director.

## 7. Acknowledgments

This MIB module is the product of the IETF SNA NAU MIB WG and the AIW APPN/HPR MIBs SIG. The editors would like to thank Katie Lee, IBM Corporation, for her work in creating the original version of this MIB.
