Definitions of Extension Managed Objects for Asymmetric Digital Subscriber Lines

Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes additional managed objects used for managing Asymmetric Digital Subscriber Line (ADSL) interfaces not covered by the ADSL Line MIB (RFC 2662).

1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIV2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

2. Introduction

The purpose of this memo is to define a supplemental set of managed objects that is not covered by the ADSL Line MIB as defined in [RFC2662]. This memo addresses the additional objects defined in ITU G.997.1 [ITU G.997.1].

3. Relationship of ADSL Line Extension MIB with standard MIBs

This section outlines the relationship of the ADSL Line Extension MIB with other MIBs described in RFCs and in their various degrees of standardization. In regards to these relationships, the ADSL Line Extension MIB follows conventions as used by the ADSL Line MIB with one exception. The value of the RFC 2863 object, `ifOperstatus`, SHALL be `down(2)` when the ADSL line interface is in power state L3, as defined in ITU G.992.1 [ITU G.992.1], which means no power. Its value shall be `up(1)` if the ADSL line interface is in power state L0 (power on) [ITU G.992.1] or L1 (reduced power). Power Status L2 [ITU G.992.1] is not applicable.

4. Conventions used in the MIB

4.1 Structure

The MIB is organized to follow the same structure of the ADSL Line MIB [RFC2662].

4.2 Additional Managed Objects

Objects specific to the management of ADSL G.Lite as defined in ITU G.992.2 [ITU G.992.2] are:

- ADSL Transceiver Unit - Central Office End (ATU-C)
Transmission System and Line Mode
- Power Management
- Counters for Fast Retrans and Failed Fast Retrans
- Counters for Severe Error Second-line and Unavailable Second
- Alternative profile configuration for the Dual line mode
interface

Besides the management of G.Lite, another object has been added in order to manage the ADSL line profile. The object is the line mode configuration.

4.2.1 ATU-C ADSL Transmission System Parameters and Line Mode

The `adslLineConfigTable` needs to be extended to cover control of the ATU-C ADSL Transmission system. Three objects are defined to monitor and configure the transmission mode as well as the actual line mode:

- Capability
- Configuration
- Actual Status

Transmission modes can further determine the line mode of the ADSL interface. For example, if `g9921PotsNonOverlapped(2)` is the actual value of the ADSL interface, the interface is operating in Full rate ADSL. If the interface is set to `g9922PotsOverlapped(9)`, the interface is operating in G.Lite mode.

The transmission mode and the corresponding line mode are defined as:

Transmission mode	Line Mode

Regional Std. (ANSI T1.413)	Full
[ANSI T1.413]	
Regional Std. (ETSI DTS/TM06006)	Full
[ETSI DTS/TM06006]	
G.992.1 [ITU G992.1] POTS non-overlapped	Full
G.992.1 POTS overlapped	Full
G.992.1 Integrated Services Digital	
Network (ISDN) non-overlapped	Full
G.992.1 ISDN overlapped	Full
G.992.1 TCM-ISDN non-overlapped	Full
G.992.1 TCM-ISDN overlapped	Full
G.992.2 POTS non-overlapped	G.Lite
G.992.2 POTS overlapped	G.Lite
G.992.2 with TCM-ISDN	G.Lite
non-overlapped	
G.992.2 with TCM-ISDN overlapped	G.Lite
G.992.1 TCM-ISDN symmetric	Full

Table 1: Transmission Mode and Line Mode

In case more than one bit is configured for an ADSL interface and both Full and G.Lite modes are selected, the interface is said to be configured in the dual mode. Only one bit can be set in the Actual object that reflects the actual mode of transmission as well as the line mode.

4.2.2 Power Management

There are three possible power states for each managed ADSL interface operating in the G.Lite mode. L0 is power on, L1 is power on but reduced and L3 is power off. Power state cannot be configured by an operator but it can be viewed via the ifOperStatus object for the managed ADSL interface. The value of the object ifOperStatus is set to down(2) if the ADSL interface is in power state L3 and is set to up(1) if the ADSL line interface is in power state L0 or L1.

An ADSL line power state, if the interface is operating in the G.Lite mode, can also be monitored by the adslLineGlitePowerState object defined in the ADSL Line Extension table. The value of the object enumerates the three power states attainable by the managed interface.

4.2.3 Fast Retrain Parameters

Section 7.4.15 [ITU G.997.1] specifies fast retrain parameters. Fast retrain parameters include two counters: fast retrain count and failed fast retrain count. These two counters have been added to all performance tables.

4.2.4 Counters for Severely Errored Second-line and Unavailable Seconds-line

ITU G.997.1 sections 6.2.1.1.7 and 6.2.1.1.9 specify two counters that are not covered by the ADSL Line MIB [RFC2662]. These two counters (severely errored seconds-line and unavailable seconds-line) are added to all the performance tables.

Unavailable seconds counts the cumulative number of seconds in which the interface was unavailable during the measured period. This counter does not include the seconds in which unavailability was caused solely by fast retrains and failed fast retrains. Fast retrains and failed fast retrains are considered to be part of the normal network operation and thus are not counted as unavailable errors.

4.2.5 Counters, Interval Buckets and Thresholds

For physical-level events, there are counters, current 15-minute and one (up to 96) 15-minute history bucket(s) of "interval-counters", as well as current and previous 1-day interval-counters. Threshold notification can be configured for each physical-layer current 15-minute bucket.

There is no requirement for an agent to ensure fixed relationship between the start of a fifteen minute and any wall clock; however some implementations may align the fifteen-minute intervals with quarter hours. Likewise, an implementation may choose to align one day intervals with start of a day.

Separate tables are provided for the 96 interval-counters. They are indexed by {ifIndex, AdslAtu*IntervalNumber}.

Counters are not reset when an ATU-C or ATU-R is reinitialized, only when the agent is reset or reinitialized (or under specific request outside the scope of this MIB).

The 15-minute event counters are of the type PerfCurrentCount and PerfIntervalCount. The 1-day event counters are of the type AdslPerfCurrDayCount and AdslPerfPrevDayCount. Both 15-minute and 1-day time elapsed counters are of the type AdslPerfTimeElapsed.

4.2.6 Alternative profile configuration for the dual line mode interface

The object, `adslLineConfProfileDualLite`, is used only when the interface (the ADSL line and, if applicable, channel) is configured as dual mode, that is, the object `adslLineTransAtucConfig` is configured with one or more full-rate modes and one or more G.Lite modes.

The object `adslLineConfProfile` defined in ADSL-MIB [RFC2662] is used as the primary full-rate profile. The newly added object in this MIB module, `adslLineConfProfileDualLite`, is used to describe and configure the G.Lite profile. Note that if one or more full-rate modes are configured, or only G.Lite modes are configured, only the original full-rate profile is needed. The dual-mode profile object is only needed when both full-rate and G.Lite profiles are needed. In this case, it will be set to the value of `adslLineConfProfile` when 'dynamic' profiles are implemented.

When 'static' profiles are implemented, however, similar to the case of the object, `adslLineConfProfileName` [RFC2662], this object's value will need to algorithmically represent the line. In this case, the value of the line's `ifIndex` plus a value indicating the line mode type (e.g., G.Lite, Full-rate) will be used. Therefore, the profile's name is a string of the concatenation of the `ifIndex` and one of the following values: Full or Lite. This string will be fixed-length (i.e., 14) with leading zero(s). For example, the profile name for `ifIndex` that equals '15' and is a full rate line will be '0000000015Full'.

5. Conformance and Compliance

See the conformance and compliance statements within the information module.

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The actual transmission mode of the ATU-C.
 During ADSL line initialization, the ADSL
 Transceiver Unit - Remote terminal end (ATU-R)
 will determine the mode used for the link.
 This value will be limited a single transmission
 mode that is a subset of those modes enabled
 by the ATU-C and denoted by
 adslLineTransAtucConfig. After an initialization
 has occurred, its mode is saved as the 'Current'
 mode and is persistence should the link go
 down. This object returns 0 (i.e. BITS with no
 mode bit set) if the mode is not known."

REFERENCE "Section 7.3.2 ITU G.997.1 "

adslLineGlitePowerState OBJECT-TYPE

SYNTAX INTEGER {

none(1),

l0(2),

-- L0 Power on

l1(3),

-- L1 Power on but reduced

l3(4)

-- L3 Power off

}

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"The value of this object specifies the power
 state of this interface. L0 is power on, L1 is
 power on but reduced and L3 is power off. Power
 state cannot be configured by an operator but it
 can be viewed via the ifOperStatus object for the
 managed ADSL interface. The value of the object
 ifOperStatus is set to down(2) if the ADSL
 interface is in power state L3 and is set to up(1)
 if the ADSL line interface is in power state L0 or
 L1. If the object adslLineTransAtucActual is set to
 a G.992.2 (G.Lite)-type transmission mode, the
 value of this object will be one of the valid power
 states: L0(2), L1(3), or L3(4). Otherwise, its

```

        value will be none(1)."
 ::= { adslLineExtEntry 4 }

```

adslLineConfProfileDualLite OBJECT-TYPE

SYNTAX SnmpAdminString

MAX-ACCESS read-write

STATUS current

DESCRIPTION

"This object extends the definition an ADSL line and associated channels (when applicable) for cases when it is configured in dual mode, and operating in a G.Lite-type mode as denoted by adslLineTransAtucActual. Dual mode exists when the object, adslLineTransAtucConfig, is configured with one or more full-rate modes and one or more G.Lite modes simultaneously.

When 'dynamic' profiles are implemented, the value of object is equal to the index of the applicable row in the ADSL Line Configuration Profile Table, AdslLineConfProfileTable defined in ADSL-MIB [RFC2662].

In the case when dual-mode has not been enabled, the value of the object will be equal to the value of the object adslLineConfProfile [RFC2662].

When 'static' profiles are implemented, in much like the case of the object, adslLineConfProfileName [RFC2662], this object's value will need to algorithmically represent the characteristics of the line. In this case, the value of the line's ifIndex plus a value indicating the line mode type (e.g., G.Lite, Full-rate) will be used. Therefore, the profile's name is a string concatenating the ifIndex and one of the follow values: Full or Lite. This string will be fixed-length (i.e., 14) with leading zero(s). For example, the profile name for ifIndex that equals '15' and is a full rate line, it will be '0000000015Full'."

9. Security Considerations

The following security matters should be considered when implementing this MIB.

- 1) Blocking unauthorized access to the ADSL MIB via the element management system is outside the scope of this document. It should be noted that access to the MIB permits the unauthorized entity to modify the profiles (section 6.4) such that both subscriber service and network operations can be interfered with.

Subscriber service can be altered by modifying any of a number of service characteristics such as rate partitioning and maximum transmission rates. Network operations can be impacted by modifying notification thresholds such as Signal-to-Noise Ratio (SNR) margins.

- 2) SNMPv1 by itself is such an insecure environment. Even if the network itself is secure (for example by using IPSec), there is no control over who on the secure network is allowed to access and GET (read) the objects in this MIB. It is recommended that the implementors consider the security features as provided by the SNMPv3 framework. Specifically, the use of the User-based Security Model STD 62, RFC 3414 [RFC3414] and the View-based Access Control Model STD 62, RFC 3415 [RFC3415] is recommended.

It is then a customer/user responsibility to ensure that the SNMP entity giving access to an instance of this MIB, is properly configured to give access to only those objects, and to those principals (users) that have legitimate rights to access them.

- 3) The profile mechanism presented in this document requires specific attention. The implementor of this MIB has a choice of implementing either 'static' or 'dynamic' profiles. This decision must be consistent with the implementation of RFC 2662.

In the case of 'static' profiles, the elements of the profile are read-write, as opposed to read-create when 'dynamic' profiles are implemented:

- adslConfProfileLineType,
- adslAtucThreshold15MinFailedFastR,
- adslAtucThreshold15MinSesL,
- adslAtucThreshold15MinUasL,
- adslAturThreshold15MinSesL, and
- adslAturThreshold15MinUasL.

This decision also impacts the mechanics of the index, adslLineConfProfileDualLite. When 'static' profiles are implemented, its value is algorithmically set by the system and its value is based on the ifIndex. Hence it is not guaranteed across system reboots. Similar to the handling of adslLineConfProfile [RFC2662], the implementor of this MIB must ensure that the profile object values associated with these indices are maintained across system reboots.

In the case of dynamic profiles, this object is set by the SNMP manager. The implementor of this MIB may want to provide a view of the profile on a customer-by-customer standpoint, but should be cautious of the dynamic nature of these objects.

4) ADSL layer connectivity from the ATU-R will permit the subscriber to manipulate both the ADSL link directly and the ADSL overhead control channel(AOC)/embedded operations channel (EOC) for their own loop. For example, unchecked or unfiltered fluctuations initiated by the subscriber could generate sufficient notifications to potentially overwhelm either the management interface to the network or the element manager. Other attacks affecting the ATU-R portions of the MIB may also be possible.

10. Intellectual Property Notice

The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on the IETF's procedures with respect to rights in standards-track and standards-related documentation can be found in BCP-11 [RFC2028]. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementors or users of this specification can be obtained from the IETF Secretariat.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights that may cover technology that may be required to practice this standard. Please address the information to the IETF Executive Director.
